Success Stories

We are a fully motivated and professional software development company established in 2018. With the usage of new and high technologies, we are creating more effective software products and other software related applications as well. Not only software-related products we have provided digital services such as graphic design, SEO services, social media marketing, etc. Our exciting array of services are mainly targeted and created to provide a one-stop-shop service to our clients. In the past year, we have come through a very successful path. During that time our company has completed more than ten major projects including mobile applications and bespoke software development as well. We are honored to have those valuable clients and their projects. These projects help us to grove as a startup and as well as it helps our clients to gain more with their business as well. Our development team has gone through various types of projects which includes fully automated process management systems as well. Not only with the local clients, but we have also worked with foreign clients as well. We are honored to have both local and foreign clients within one year. Where we have worked with some of the leading companies in India, Pakistan, and the USA. With 10+ thriving software products co-created to date, check out our success stories.

Apparel Mo

Product Overview

Apparel Mo is a more effective apparel process management system for small and medium scale garments in Sri Lanka that allows garment owners and managers to manage their garment's process with end to end support. It is a custom made solution based on our specific client requirements. This product provides an easy and secure management system for the process of the garments.

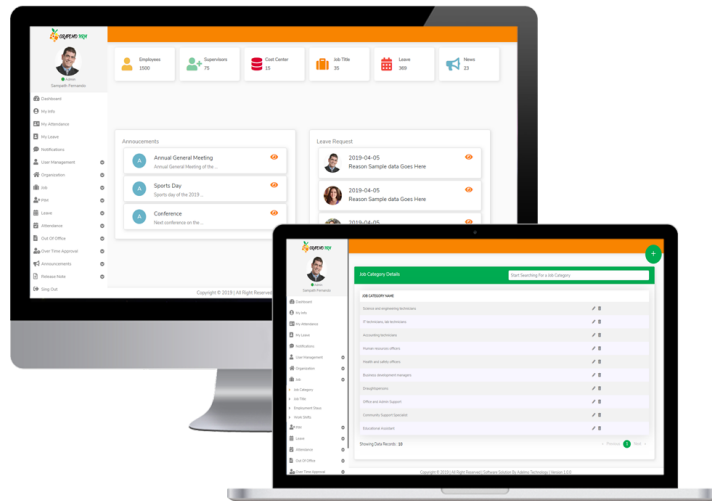

Problem

The Jeleena Apparel team had a vision of developing process management for all processes in Jeleena Apparel and they wanted a highly reliable, cost-effective partner to create this engaging platform. We came on board to make that vision a reality.

Solution

A mobile-responsive, web-based application was created using Angular, Apache 2 and PHP Slim. Through this system, they were able to manage their process by one endpoint. Testing was done by us as well, and the team together was able to deliver a successful product at the end of the project.

HRM

Product Overview

HRM is a cloud-based human resource management system that we have developed for our very first USA client. This is a bespoke hrms solution for the client and our team was able to provide a more effective product that can be used by different sector companies as well. HRM provides features to manage all HR related functions within the system is self.

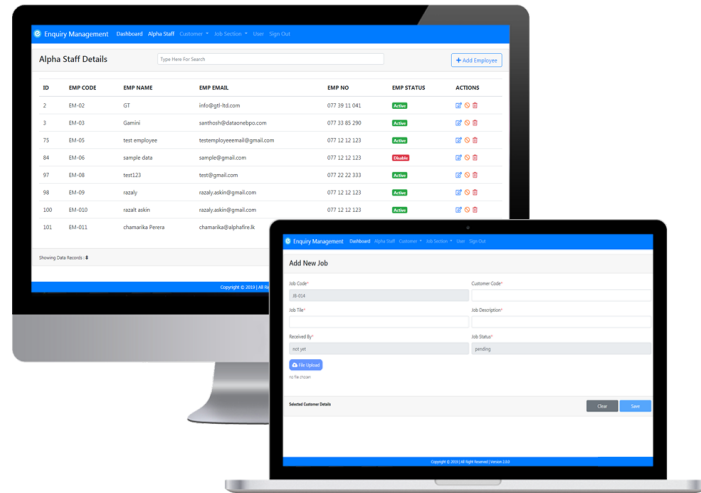

Problem

Our client wants to create a fully functional HR system for managing they are all hr related functions in a cost-effective way. The main problem is to manage separate cost centers for each department and make the system fully customizable. So our developer team plays a good role to provide a more effective solution for our client.

Solution

Our team provides a cloud-based centralized software solution we the support of high level rest API technology. The material UI design is considered and used as a UI design for the front end which adds more UX for the system. This solution is created under the usage of angular, apache 2 and node js. Product testing was done by the client and the unit testing was done by the developer team. This product was able to reduce more than 5 hours of paperwork per day.

EMS

Product Overview

EMS is Enquiry Management System which is our team that was created for our Pakistan client. This product is mainly targeting for managing all the inquiries which are submitted by the clients. The product has the capability of handling all client-related details and as well as all the inquiries without any issues. The company can create and issue system login credentials and send it through the email for the client automatically. So this system can centralized customer-related functions in the business in a more cost-efficient way.

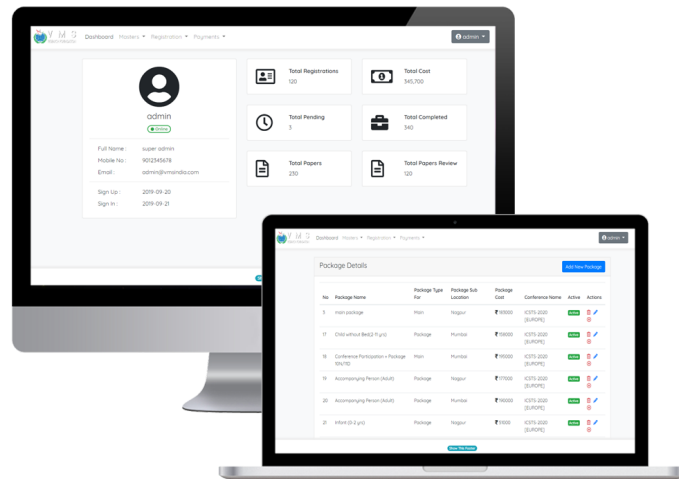

Problem

Our client wants to maintain customer-related data and functions within a single system in a cost-effective way. And also the client wants to provide a secure way to login to the system and manage incoming system traffic by admin credentials. All the inquiry related documents also have to manage by using the system and the system has to provide the feature and space to store documents safely.

Solution

Our developer team has provided a more secure cloud-based solution for client which enable all the requirements provided by the client. With the usage of angular and PHP developers were able to provide a more secure login and document management as well.

CMS

Product Overview

Our very first Indian client wants to create an advanced bespoke conference management system for their business. This system is containing more than 5 user roles that provide different user privileges. The system has the capability of managing all users with their respective functions and also provides a secure interface to integrate the outside users as well. Document handling and payment handling also done within the system to reduce the paperwork. The system allows users to view all the data and generate reports as well.

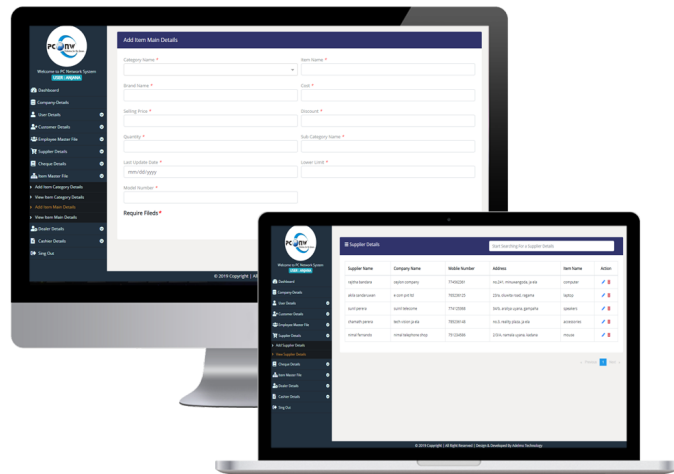

Problem

The client wants to develop a system that allows managing more than 5 user roles and privileges with different functionalities. They accepted a more efficient and cost-effective system solution under advance system requirements. The main problem is to manage all system-related data in a centralized database with a high secure rest API endpoints. System URL routing is also built under customer requirements which creates a very difficult challenge.

Solution

Our developer team was able to provide cloud-based solutions with rich UI design and centralized database design. With the use of angular and node js team was able to provide a more secure and functional solution to the client.

PC NETWORKS

Product Overview

PC Networks is another valuable local client who sells computer and network-related accessories and products to local clients. With more than two branches PC Networks spared its service chain among its valuable customers. So PC Networks requires a centralized management system to manage all sales and stock related data. Issuing invoices, managing customers and suppliers, managing stocks, providing discounts, calculating employee performance are major functionalities in the system.

Problem

Providing different user roles and connection limits with the centralized database is the major challenge in the system. And maintaining the system uptime with more than two branches is another challenge. Providing POS-based UI design for the system is very hard to manage the responsiveness of the system.

Solution

With the usage of bootstrap and custom CSS, our UI designers were able to provide to effective responsive UI design to the system. And also front end developers used angular based technologies meantime backend developers used node js and PHP to handle advanced security features.
